

Universal Math

I graduated from College in 1976. I don't remember much Calculus beyond the Fundamental Theorem of College Life (FTCL^x) :

$$\int e^x = F(u^n) \quad (\text{en}).$$

My linguistic abilities are a little rusty too:

$$\int e^x = \overline{w} \quad (\text{de})$$

As I remember, it was pronounced "w *under bar*" in German.

Anyway, I needed a Math example, and this will have to do.

^x The acronym is attributed to Computer Science Majors, for whom most mathematics is inexplicable. Hence the useful acronym, enabling the Cognoscenti to nod enthusiastically when they know what the words are, quite aside from any actual implementation experience.
